## Lec.2: **Electromagnetic Radiation**

**Asst.Lec.Dumoaa Haider Shakir**

# Introduction

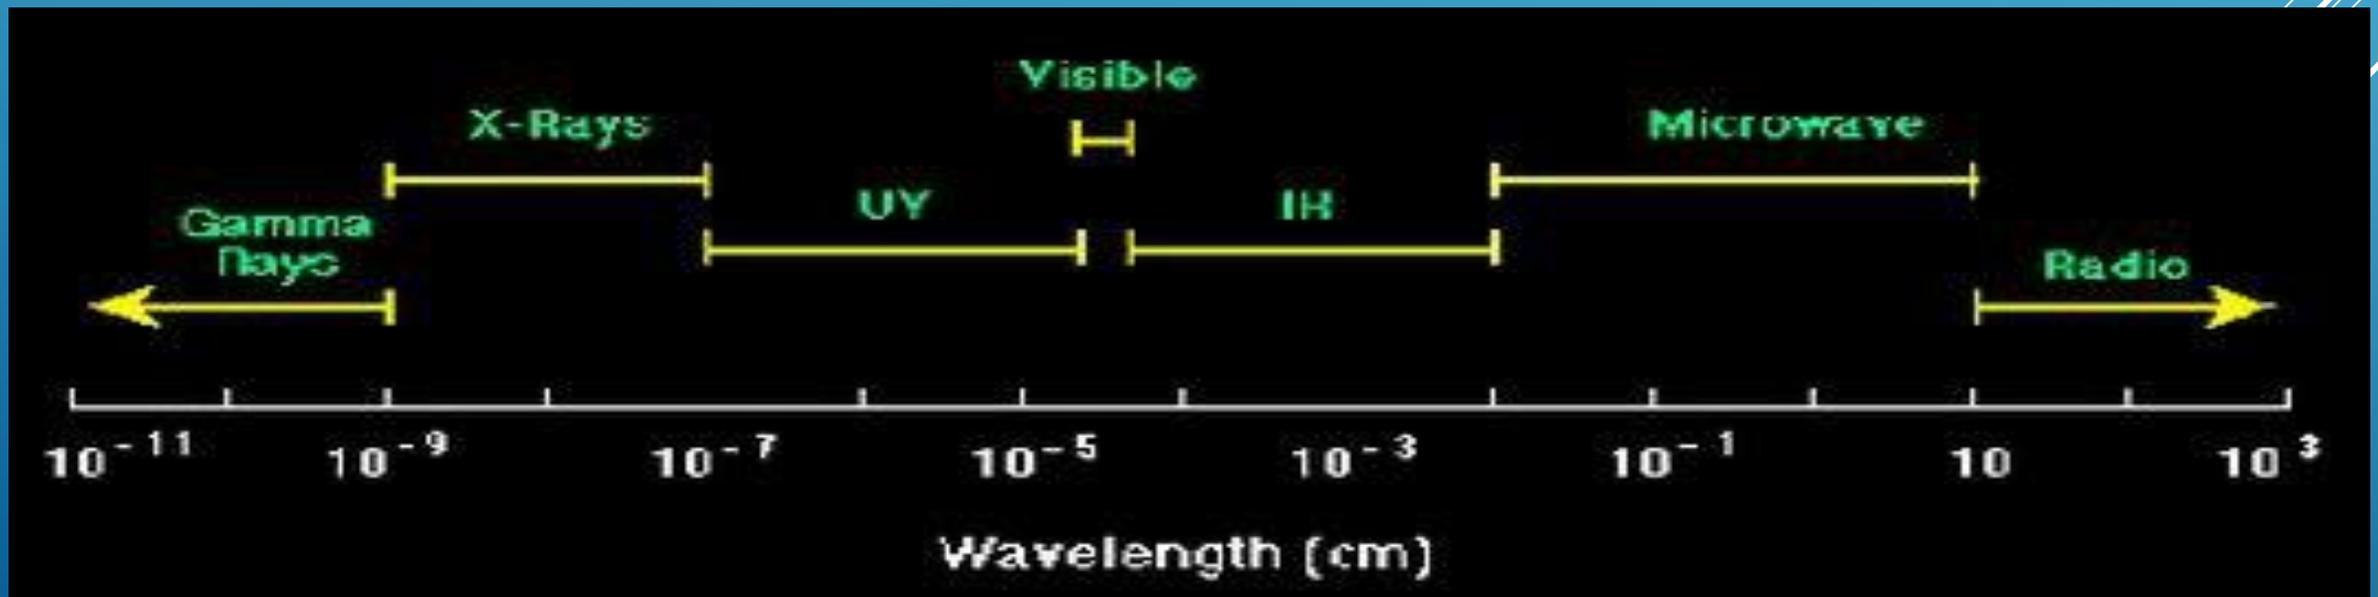

- Electromagnetic radiation (sometimes abbreviated EMR) is a ubiquitous phenomenon that takes the form of self-propagating waves in a vacuum or in matter. It consists of **electric** and **magnetic** field components which oscillate in phase perpendicular to each other and perpendicular to the direction of energy propagation.

## Electromagnetic Wave (EM wave)

## Types of Electromagnetic radiation

Electromagnetic radiation is classified into several types according to the frequency or its wave; these types include (in order of increasing frequency and decreasing wavelength): radio waves, microwaves, infrared radiation, visible light, ultraviolet radiation, X-rays and gamma rays.

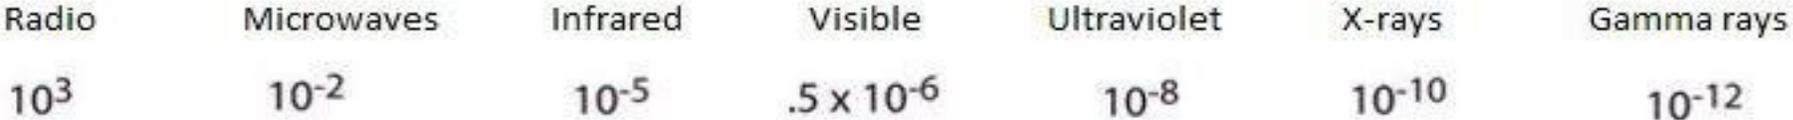

- ❑ **Radio Waves:** Used for wireless communication, including radio and television broadcasting, cell phones, and Wi-Fi.
- ❑ **Microwaves:** Microwave ovens, radar systems, satellite communication, and some wireless technologies.
- ❑ **Infrared Radiation:** Infrared is used in night vision devices, remote controls, and as a heat source in some industrial processes.
- ❑ **Visible Light:** Used for human vision, photography, and optical communication systems like fiber optics
- ❑ **Ultraviolet Radiation:** UV radiation is used in sterilization, fluorescence, and in some types of curing processes (e.g., UV curing of inks and coatings).
- ❑ **X-Rays:** Medical imaging, such as X-ray radiography and CT scans, as well as industrial inspection and material analysis.
- ❑ **Gamma Rays:** Used in medical imaging (PET scans), cancer treatment (radiotherapy), and in some industrial applications for inspecting the integrity of materials.

# Electromagnetic spectrum

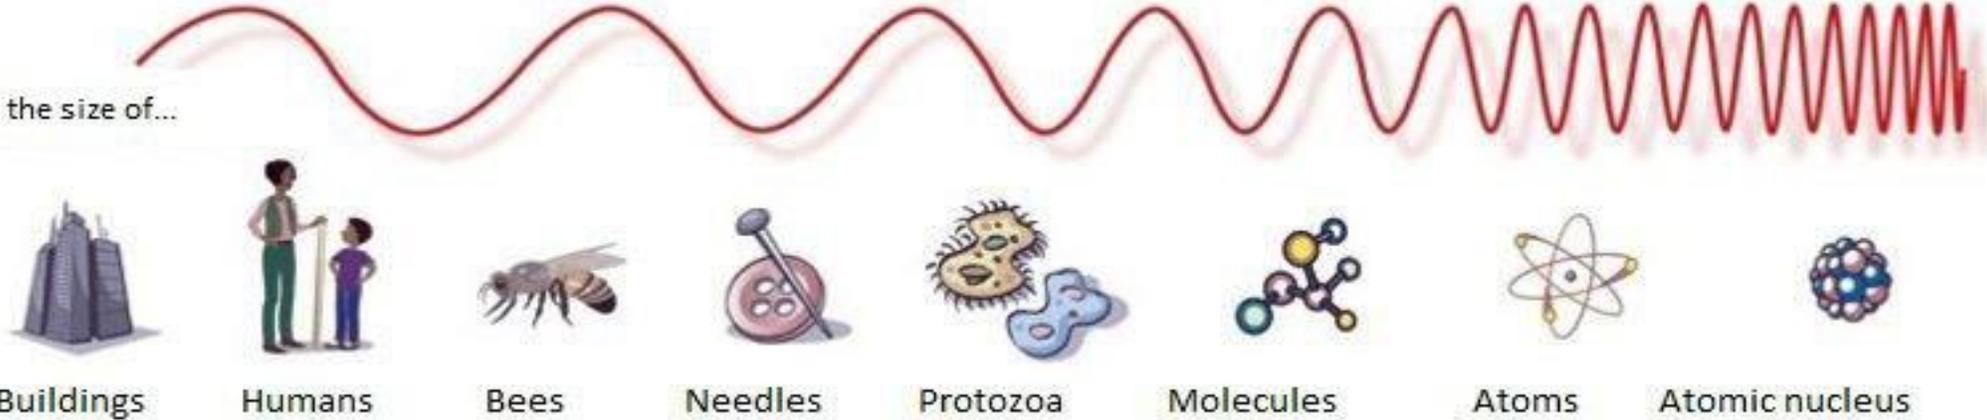

Penetrates the earth's atmosphere

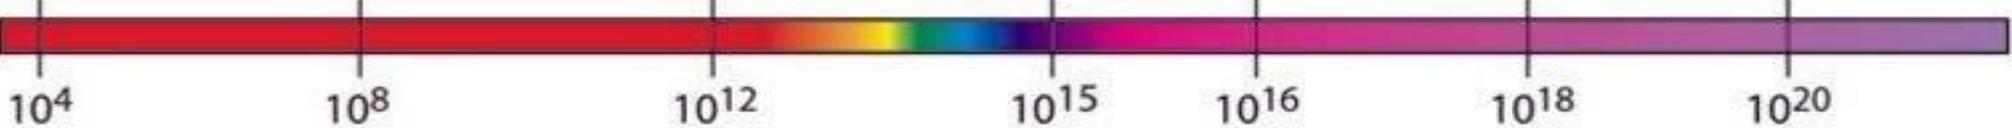

Wavelength (metres)

About the size of...

Frequency (Hz)

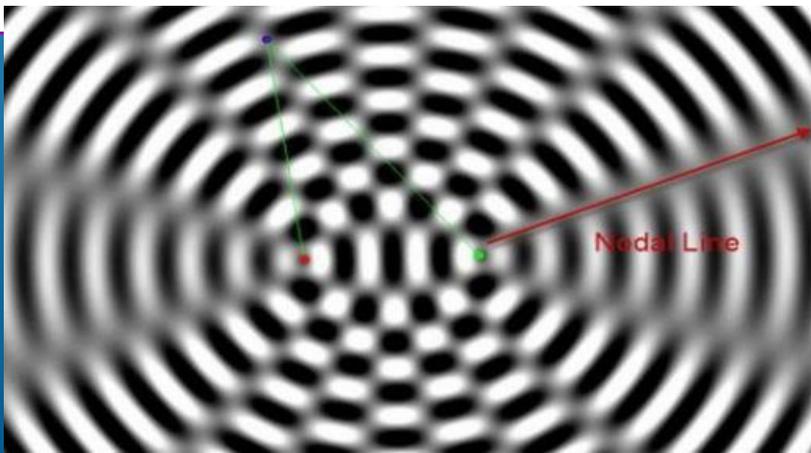

## Properties of Electromagnetic radiation

- ❑ **A small and somewhat variable window of frequencies is sensed by the eyes of various organisms; this is what we call the visible spectrum, or light.**
- ❑ **EM radiation carries energy and momentum that may be imparted to matter with which it interacts.**
- ❑ **Electromagnetic waves are transverse waves.**
- ❑ **Electromagnetic waves travel at the speed of light  $c = 2.998 \times 10^{10}$**

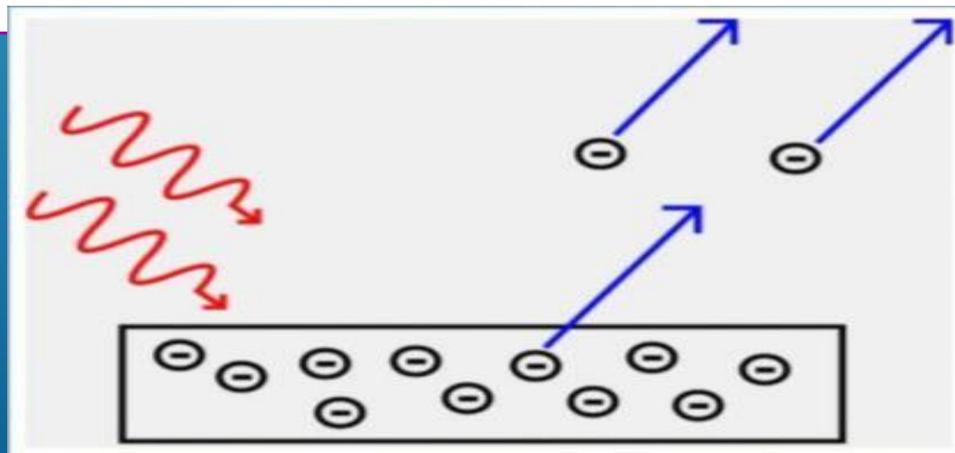

# EMR WAVE-PARTICLE DUALITY

- ❑ EM radiation exhibits both wave properties and particle properties at the same time (wave-particle duality).
- ❑ both wave and particle characteristics have been confirmed in a large number of experiments.
- ❑ In the wave aspect, the electromagnetic can exhibit interference and diffraction patterns similar to waves.
- ❑ In the particle aspect, particles have well-defined positions and momenta, behaving as discrete entities.

## ❑ Wave characteristic

## Particle characteristics

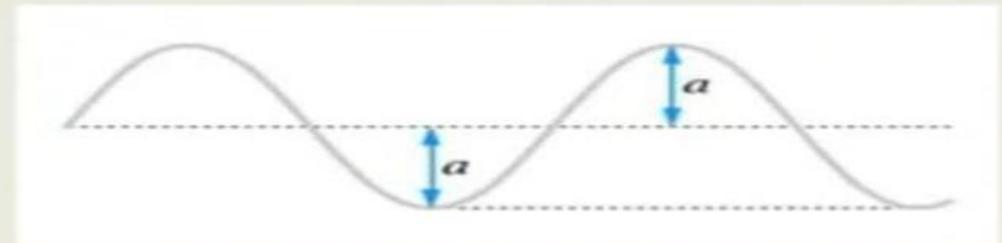

# The Parameters That Characterize A Wave "Amplitude Wavelength , Wavenumber And Frequency

- ▶ **Amplitude (a):** It is a measurement of the maximum vertical value of a single cycle.

**Wavelength:** It is the distance between the two adjacent crests (C-C) or troughs (T-T) in a particular wave and denoted by  $\lambda$  (lambda). It can be expressed in Angstrom/in millimicrons ( $m\mu$ ).

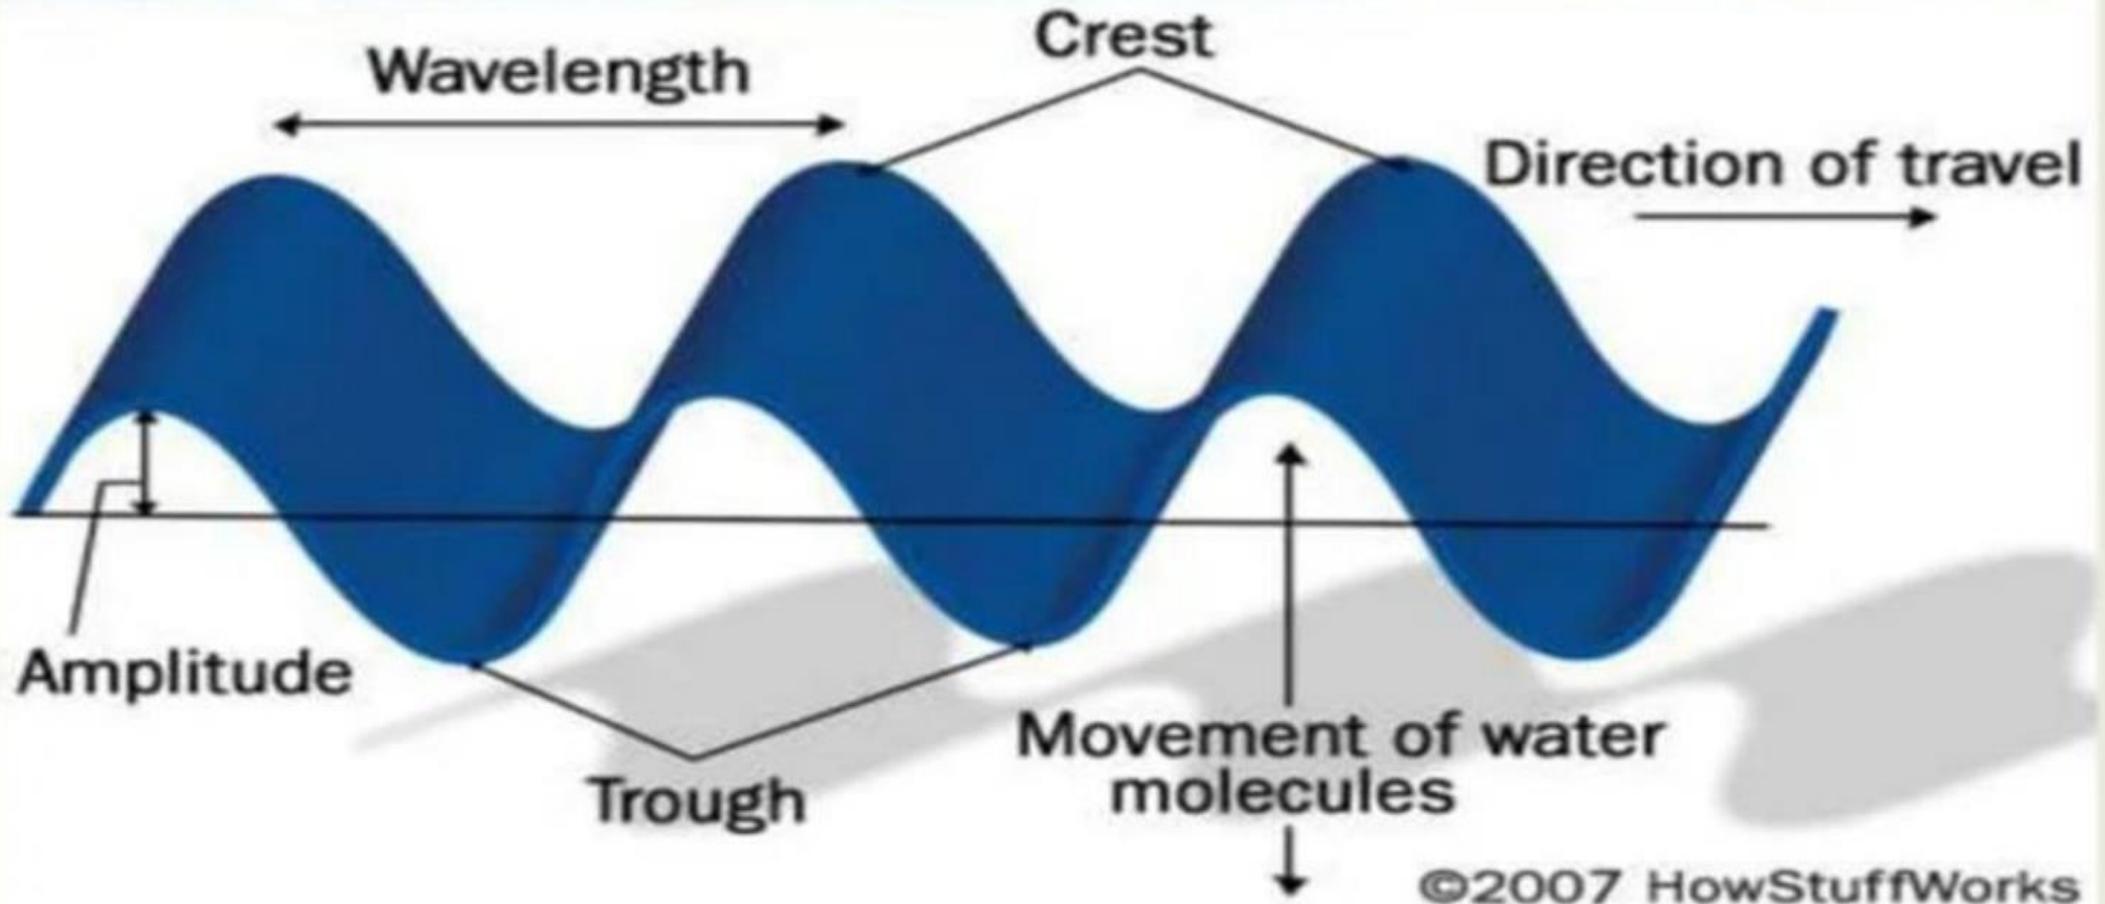

$$1 \text{ \AA} = 10^{-8} \text{ cm}; \quad 1 m\mu = 10^{-7} \text{ cm}$$

- **Crests:** it is point on a wave with the greatest positive value or upward displacement in a cycle
- **Trough:** is inverse of crest

# Electromagnetic Waves

## Transverse Wave

**Wave number:** It is defined as the total number of waves which can pass through a space of one cm. It is the reciprocal of wavelength and is expressed in  $\text{cm}^{-1}$ .

$$\bar{\nu} = \frac{1}{\text{wave length}}$$

If the wavelength of a light is known, the corresponding wave number can be calculated. For example, if the wavelength of a radiation is  $2.5 \mu$ , then the corresponding wave number can be calculated as follows;

$$\lambda = 2.5 \mu = 2.5 \times 10^{-4} \text{ cm}$$

$$\text{Thus, Wave number, } \bar{\nu} = \frac{1}{\lambda \text{ in cm}} = \frac{1}{2.5 \times 10^{-4}}$$

$$= 4000 \text{ cm}^{-1}$$

An important aspect of the nature of light is frequency.

**Frequency:** It is defined as the number of waves which can pass through a point in one second. It is expressed as  $\nu$  is cycles/sec or in Hertz (Hz) where  $1 \text{ Hz} = 1 \text{ cycle sec}^{-1}$

Frequency is inversely proportional to the wavelength, thus greater the wavelength, smaller is the frequency.

$$\text{Frequency} \propto \frac{1}{\text{Wavelength}}$$

$$\text{Frequency, } \nu = \frac{c}{\lambda}$$

## Frequency continued.....

The wavelength of the visible light is 3800 -7600 Å, calculate the corresponding frequency range.

a)  $\lambda = 3800 \text{ \AA}$   
 $= 3800 \times 10^{-8} \text{ cm}$

Thus,

$$\begin{aligned} \nu &= \frac{c}{\lambda} \\ &= \frac{2.998 \times 10^{10} \text{ cm sec}^{-1}}{3800 \times 10^{-8} \text{ cm}} \\ &= 7.88 \times 10^{14} \text{ sec}^{-1} \\ &= 7.88 \times 10^{14} \text{ Hz} \end{aligned}$$

b) For  $\lambda = 7600 \text{ \AA}$ , do it by yourself
